

THE PROBLEM WITH

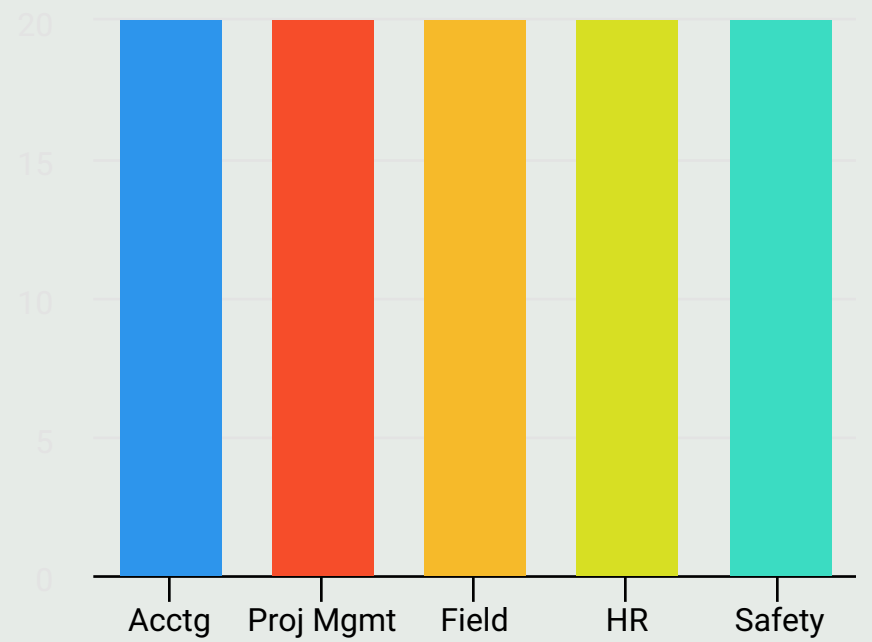

Construction Software

Decreases Efficiency

Based on a recent study by McKinsey Global, thirty-three percent (33%) of an employee's day is spent gathering information and collaborating with their team.

- Searching for Information 19%
- Internal Collaboration 14%
- Email Handling 28%
- Role Specific Tasks 39%

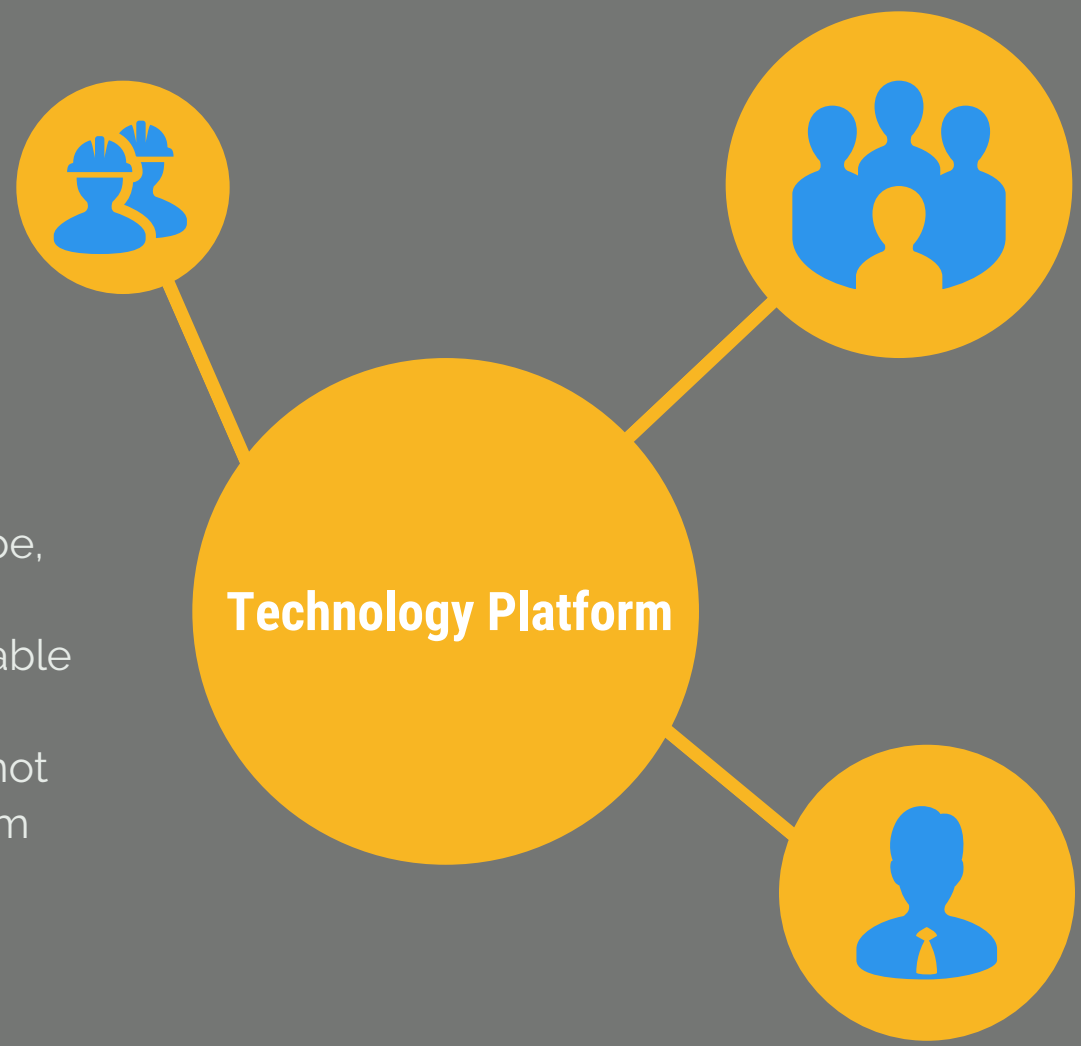

Creates Information Silos

The construction industry contains several departments that don't communicate easily with current software offerings.

The Answer

While there is not, nor will there ever be, a perfect software solution, there are many options today that weren't available to the construction industry even last year. Look for a platform to build on, not a software to purchase. Give your team the tools to succeed.

Cost of Inefficiency

While profit leaks on the job can be mitigated by good procedures and project management tools, efficiency leaks are just as costly.
